- Sub D2*
-
1. (Twice Amended) A method of establishing a communication channel between a base station and a mobile station, comprising:
- (a) generating control signals and data signals within the communication channel, said control signals having a first sequence of L-bits and a second sequence of L-bits;
 - (b) autocorrelating the first and second sequences to generate first and second autocorrelated values;
 - (c) cross-correlating the first and second sequences to generate first and second cross-correlated values; and
 - (d) combining the first and second autocorrelated values and the first and second cross-correlated values.
-

34. (Amended) A frame structure for a communication system, each frame having 15 slots and each slot having N number of pilot bits, where $2 \leq N \leq 16$, such that there are N number of pilot bit patterns of 15 bits in the frame, wherein the improvement comprises N number of pilot bit patterns having at least one of the following pilot bit patterns:
